

**Github URL to access the Weather project:**

<https://github.com/arpitagupta06/WeatherRepo>

**Use the application:**

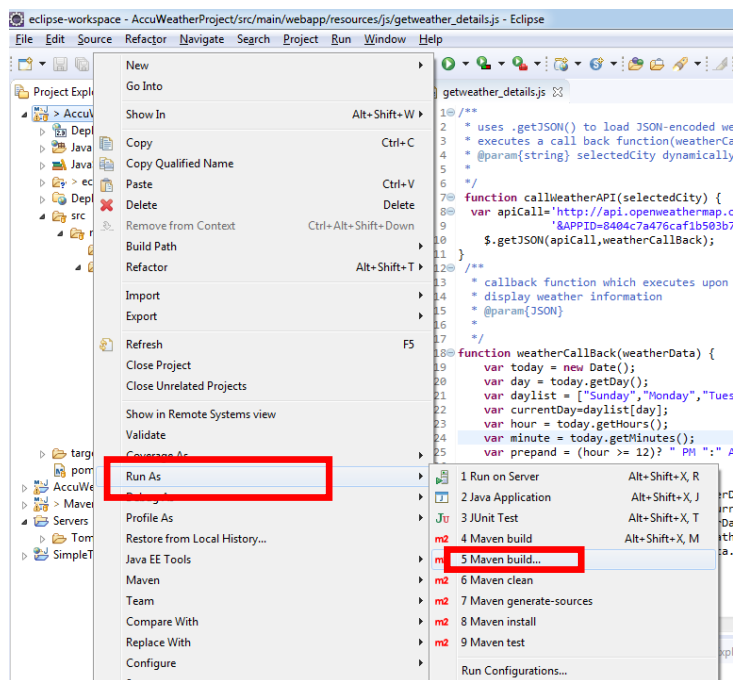

You can import this project into eclipse with below process:

1. File -> Import -> Git -> Projects From Git > URI.
2. Enter the above Github repository url.
3. Select the branch.

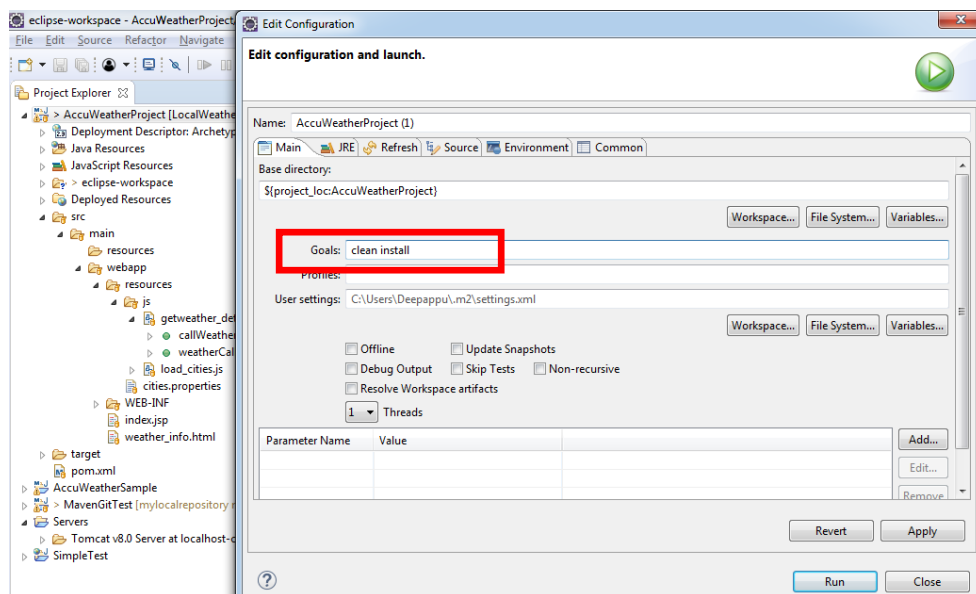

The project will be imported to eclipse.

**Build the application:**

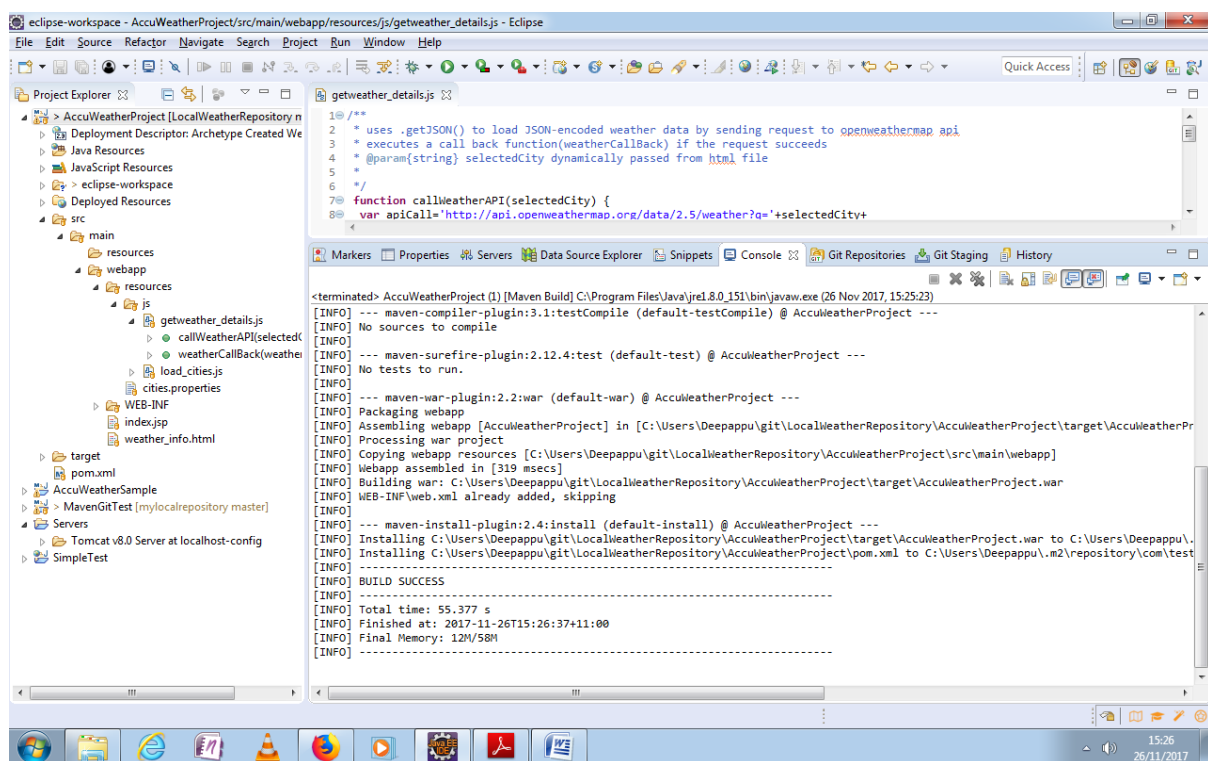

To build the project right click on the project ->Run as ->Maven build

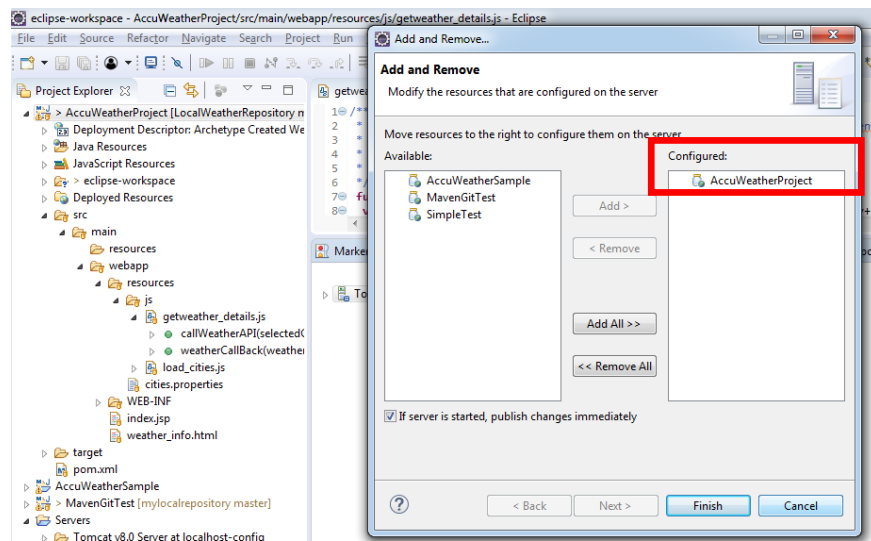

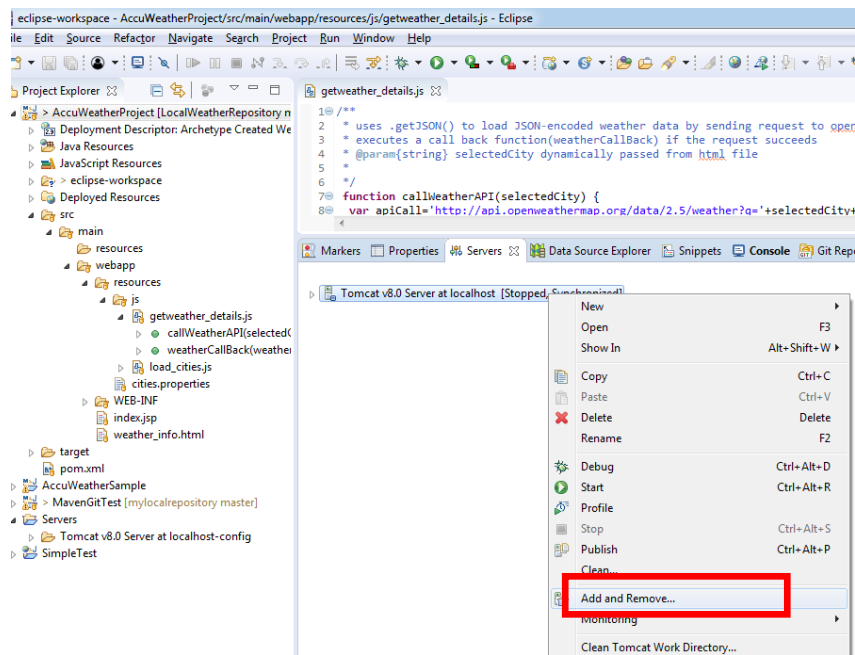

In the next window give clean install in the Goals text box and click on run.

You can see below message on console for Build success.

Now go to servers tab and right click on server->add or remove->select your project ->click finish

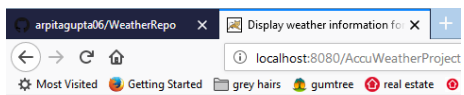

Now your project is available on server.

Now start the server and open the browser and give below URL to run the application:

[http://localhost:8080/AccuWeatherProject/weather\\_info.html](http://localhost:8080/AccuWeatherProject/weather_info.html)

you can see below screen:
